

BinControl

Ensures that the load is not contaminated with incorrect waste fractions

Each lifting position is equipped with an LR20 light bar that clearly indicates whether the waste bin should be emptied or not: When the bin is moved towards the lifter, an automatic check is carried out against the digital route. If the light bar shows a pulsating white light, the waste bin should be emptied; if the light is steady orange, it should not be emptied.

BinControl is part of the new generation of Smart Modules – a modular, scalable and future-proof concept for maximum operational reliability and efficiency. Smart Modules are included in our new technology platform Infinity, which replaces Helios.

Light signals indicate whether the bin is scheduled for emptying or not.

Avoid incorrect emptying, save time and increase efficiency.

Easy to install with flexible placement.

Robust construction.

Ensures that the correct bin is emptied.

Integrated with digital route software.
